                                             The present sequence encodes the human anti-tissue factor light chain variable region from an antibody that binds native human tissue factor (TF) and does not bind non-native TF. The antibody capable of specifically binding native TF may be used for inhibiting blood capulation and also for reducing TF levels in a mammal. The antibodies coagulation and also for reducing TF levels in a mammal. The antibodies can be used, e.g. to treat thromboses, particularly to prevent or inhibit restenosis, or other thromboses following an invasive medical procedure cuch as arterial or cardiac surgery (e.g. angioplasty, endarterectomy, deployment of a stent, use of catheter, graft implantation or use of an arteriovenous shunt). The antibodies can also be used as a carrier for drugs, particularly pharmaceuticals targered for interaction with a blood clot such as streptokinase, itssue phasminogen activator (t-PA) or urokinase, or a cytotoxic agent by conjugating a suitable toxin to the antibodies can be used for treating a trimbody. Further the antibodies can be used for treating a trimbody condition associated with cardiovascular disease, an coplastic disease or as a thrombolytic agent. The antibodies can also be used for detection and diagnosis

This invention relates to a novel method for producing a humanised antibody variable (V) domain or its fragment by optimising sequence similarity between individual antibody framework regions (FRs) in order to identify suitable human FRs (huFRs). Specifically, it refers in order immune system molecules i.e. humanised monoclonal antibodies that exhibit suitable binding affinity with reduced immunospenicity in humans. The present invention describes a method of mutagenising DNA of non-human FRs to encode humanised FRs having an amino acid sequence that is substantially identical to the selected human FR previously identified through sequence similarity searching. As such, this method provides through sequence similarity searching. As such, this method provides humanised light or heavy chain V domains of the sequence huFRI-CDRI-huFR2-CDR2-huFR3-CDR3-huFR4, which can be used as therapeutic or diagnostic products to treat and/ or diagnose diseases in humans and animals.

Furthermore, the method expands the number of best fit possibilities that can be generated and provides a rational basis for assembling nearly all humanised immune system molecules of interest. This polynucleotide sequence is a murine anti-tissue factor light chain antibody H36-D2-B7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 ATCACATGCCTGGCAAGTCAGACCATTGATACATGGTTAGCATGGTATCAGCAGAAACCA 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel method for treating or preventing (MI) septic shock syndrome in a mammal, involving administering to the mammal an effective amount of an antibody that binds native human tissue factor and does not substantially bind non-native tissue factor, where the factor X binding to the complex is inhibited and the administration is sufficient to prevent or treat the septic shock syndrome in the mammal. In (MI), the antibody has the binding specificity for native human tissue factor about equal to or greater than H36.D2.B7 (ATC HB-12255), and is a monoclonal chimeric antibody. An antibody of the invention has mathadererial and immunosuppressive activity, and acts as an inhibitor of binding between factor X or factor Via and tissue factor/factor VIIa complex. The present sequence encodes the light chain variable region of the murine antibody of the invention, H36.D2.B7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Treating or preventing septic shock syndrome in mammal, involves administering antibody that binds native human tissue factor and does not substantially bind non-native tissue factor.

H36.D2.B7 anti-tissue factor light chain variable region encoding DNA. (first entry) 14-JUL-2005 **8**84888

ADZ40936 standard; DNA; 321

ADZ40936

ADZ40936;

Antibodies binding to native human tissue factor without substantial binding to non-native tissue factor, useful for inhibiting blood coagulation, for reducing tissue factor levels in a mammal, and for 1. .321

The invention relates to an antibody (I) that binds native human tissue factor and does not substantially bind non-native tissue factor. Also clescribed: (I) an isolated nucleic acid (II) comprising a sequence encoding at least a portion of an antibody that binds native human tissue factor; (2) a recombinant vector (IV) comprising (II), where (IV) can express at least a portion of an antibody that binds native human tissue complexes with native tissue factor and factor X binding (MI) blood complexes with native tissue factor and factor X binding to the complex complexes with native tissue factor and factor X binding to the complex is inhibited; (S) reducing (M2) tissue factor levels in a mammal by administering the antibody covalently linked to a cell toxin or to an effector molecule to provide complement—fixing ability and antibody.

CC defector molecule to provide complement—fixing ability and antibody cordinated cytotoxicity, where the antibody contacts cells expressing tissue factor to reduce tissue factor levels in the mammal; contacting the sample with the antibody (I), where the antibody is and (6) detecting the sample with the antibody (I), where the antibody is and contacting the sample with the antibody (I), where the antibody is contacting tissue factor in a biological sample. (I) is useful for inhibiting blood coagulation in a mammal complexed at thromboembolic condition associated with the treatment of a thromboembolic condition associated with conversion contents and testenosis. The antibodies of the invention content as thrombosis and restenosis. The antibodies of the invention content as thrombosis and restenosis. The antibodies of the invention of especially bind to non-native or denatured tissue factor and do not substantially bind to non-native or denatured tissue factor. The antibodies prevent conversion of factor X to its activated form factor. The interpretation of the tester sequence encodes the H36.D2.B7 anti-tissue factor light chain variable region.

The present sequence is the coding sequence for the light chain variable region (VL) of anti-recombinant human tissue factor (TF) murine antibody H36.D2.B7 (ATCC HB-12255). The invention relates to antibodies, especially humanized H36.D2.B7, that provide superior anticoagulant activity by binding native human TF with high affinity and specificity. The antibodies bind human TF, either alone or present in a TF.Factor VIIa complex, effectively preventing Factor X (or Factor IX) binding to TF or the complex, and thereby reducing blood coagulation. The humanized antibodies are useful for inhibiting blood coagulation or blood clot formation, anglogenesis, tumour metastases or inflammation in a mammal. They are also useful as drug carriers, as cycotoxic agents, for reducing TF levels in mammals, and for in vivo diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             241 GAAGATTTGTAAATTA-TTACTGTCAACAAGTTTACAGTTCTCCATTCACGTTCGGTGC 299

                                                                                                              The present invention describes chimeric antibody (Ab) heavy (H) chains containing the variable region of the H chain of a mouse monoclonal Ab chain of a human Ab. The variable region is one of six specified the H chain of a human Ab. The variable region is one of six specified sequences (which are the H chain variable regions from mouse monoclonal Ab's ATR-2,3,4,5,7 or 8). Also described are chimeric Ab light (L) chains containing the variable region of the L chain of a mouse monoclonal Ab recognising human tissue factor (hTF) and the constant region of the L chain of a human Ab, the variable region being one of six specified sequences (which are the L chain variable regions from mouse monoclonal Ab recognising human tissue factor (hTF) and the constant for the treatment and prevention of thrombotic disease, especially of disseminated intravascular coagulation (DIC). The humanised antibody has the high hTF binding activity of the mouse monoclonal antibody but greatly reduced immunogenalcity. AAA233001 to AAA23301 and Y527007 to AAA25767 represent

The present invention describes chimeric antibody (Ab) heavy (H) chains containing the variable region of the H chain of a mouse monoclonal Ab crecognising human tassue factor (hTF) and the constant region of the H chain of a human Ab. The variable region is one of six specified sequences (which are the H chain variable regions from mouse monoclonal Ab TRR-2.3,4.5,7 or 8). Also described are chimeric Ab light (L) chains containing the variable region of the L chain of a mouse monoclonal Ab recognising human tissue factor (hTF) and the constant region of the L chain of a human Ab, the variable region being one of six specified sequences (which are the L chain variable regions from mouse monoclonal C chain of a human Ab, the variable region being one of six specified sequences (which are the L chain variable regions from mouse monoclonal c not prevention of thrombotic disease, especially of disseminated intravascular coagulation (DIC). The humanised antibody has the high hTF binding activity of the mouse monoclonal antibody but greatly reduced immunogenicity. AA233001 to AA233001 and Y527007 represent invention

The invention relates to a non-infectious nucleic acid construct encoding are recombinant (e.g., single chain) antibody molecule. The nucleic acid construct is adapted for in vivo establishment of protective immunity to an infectious disease in an animal, or is formulated for in vivo prevention of an allergic reaction to an allergen or a reaction caused by the presence of a toxic substance in an animal. Constructs of the invention are thus useful for treating infectious disease caused by viral haemorrhagic septicaemia virus (VHSV) (fish), infectious haemotopoietic fish), bovine viral diarrhoea virus, pseudorables virus (pigg), plasmocytosis virus (mink), feline leuksemia virus, human immunodeficiency virus, and hepatitis A virus (human). Genetic

                                                                                                                             The invention relates to a method of selecting a high-functioning protein which comprises constructing a protein-coding DNA library, transcribing DNAs, attaching a spacer to the 3' end of transcribed RNAs and constructing a library of molecules assigned to genotype and phenotype in a cell-free translation system, treating the library of assigned amplecules, binding an assigned molecule to a target molecule and amplifying nucleic and The method is useful for selecting a high-functioning protein by selecting a protein interacting with a target molecule. The method is useful for manufacturing a protein which interacts with a target useful for manufacturing a protein which interacts with a target suspense and hypertension. The method is rapid and useful for treating cancer and hypertension. The method is rapid and efficient. The present sequence represents a high-functioning protein

This sequence encodes the C179Fv-PP fusion polypeptide. The encoded sequence is an anti-human influenza A type virus antibody. The antibody recognises the stem region of the hemagglutinin (HA) molecule of the HIM1 and H2N2 subtypes of human influenza A type virus, and shows neutralisation activity against these two subtypes. The antibody shows no recognition of the H3N2 subtype. Artificial antibodies (such as this) and polypeptides are useful in the diagnosis and treatment of human influenza. As the antibodies recognise the stem region of the HA molecule changes. This provides an advantage over current vaccines, as the virus periodically alters it's HA molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               589 GACATCGAGCTCACCCAGTCTCCTGCCTCCCAGTCTGCCATCTCGGGAGAAAGTGTCACC 648

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò
prophylaxis methods using such constructs are useful for the transient protection of individuals against exposure to pathogens or toxins where con efficient vaccines are available, for inducing the synthesis of antibodies of a desired specificity for use in immunocompromised cantibodies of a desired specificity for use in immunocompromised cantibodies. And for protecting an individual against an allergic administration of plasmid-borne genes do not involve specific activation of the immune system in the individual. Prophylaxis against infectious diseases takes place without any side effects such as the transfer of infectious diseases or induction of hypersensitivity following repeated administration. The single chain antibodies will be systemically distributed by the body fluids and protect the individual if infection with the pathogen occurs. The present sequence represents a portion of a construct of the invention which encodes a single chain antibody. Bull is derived from the variable regions of the VHSV-reactive murine monoclonal antibody from the variable regions of the YHSV-reactive murine monoclonal antibody beta (TGF-beta) signal peptide at the N- terminus (to ensure secretion of the single chain antibody) and the human kappa light chain constant constant (used as a tag to facilitate detection) at the C-terminus

The encoded sequence is an anti-human influenza A type virus antibody. The antibody recognises the stem region of the haemagajutinin (HA) modecule of the HINI and HANZ subtypes of human influenza A type virus, and shows neutralisation activity against these two subtypes. The antibody shows no percognition of the HANZ subtype. Artificial antibodies (such as this) and polypeptides are useful in the diagnosis and treatment of human influenza. As the antibodies recognise the stem region of the HA molecule molecule, the influenza virus will be recognised even if the HA molecule

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method of selecting a high-functioning protein which comprises constructing a protein-coding DNA library, transcribing DNAs, attaching a spacer to the 3' end of transcribed RNAs and constructing a library of molecules assigned to genotype and phenotype in a cell-free translation system, treating the library of assigned molecules, binding an assigned molecule to a target molecule and amplifying nucleic acid. The method is useful for selecting a high-functioning protein by selecting a protein interacting with a target molecule. The method is useful for manufacturing a protein which interacts with a target molecule. The molecule. The single stranded antibodies are useful for treating cancer and hypertension. The method is rapid and efficient. The present sequence represents a high-functioning protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Selecting a high-functioning protein which is useful for treating cancer and hypertension, comprises selecting a protein interacting with a target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            180

```

```
which comprises constructing a protein-coding DNA library, transcribing DNAs, attaching a spacer to the 3' end of transcribed RNAs and constructing a library of molecules assigned to genotype and phenotype in a cell-free translation system, treating the library of assigned molecules, binding an assigned molecule to a target molecule and amplifying nucleic acid. The method is useful for selecting a high-functioning protein by selecting a protein interacting with a target molecule. The method is useful for manufacturing a protein which interacts with a target molecule. The single stranded antibodies are useful for treating cancer and hypertension. The method is rapid and efficient. The present sequence represents a high-functioning protein related DNA.

Library is oligo-dT primed and directionally cloned. cDNA
was prepared from a glandular pool of tissues from thyoid,
parathyroid, adrenal, cortex and pineal gland. 5' and 3'
adaptors were used in cloning as follows: 5' adaptor
sequence: 5'-CACGCCATATGGCC-3' and 3' adaptor sequence:
5'-ATCTAGAGGCGACGCGCACTG-dT(30) BN-3' (where B = A,
C, or G and N = A, C, G, or T). Average insert size 1.38
by PCR. This library was enriched for full-length clones
and was constructed by Clontech Laboratories (Palo Alto,
CA). Note: this is a NIH_MGC Library."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     727 bp DNA linear GSS 11-OCT-2002

Sfil (ggccattatggcc); Site_2: Sfil (ggccgctcggcc);
Library is oligo-dT primed and directionally cloned. cDNA
was prepared from a glandular pool of tissues from thyoid,
parathyroid, adrenal, cortex and pineal gland. 5' and 3'
adaptors were used in cloning as follows: 5' adaptor
sequence: 5'-CACGGCGATTATGGCC-3' and 3' adaptor sequence:
5'-ATTCTAGAGGCGGGGGGGGCGATG-GT(30)BN-3' (where B = A,
C, or G and N = A, C, G, or T). Average insert size 1.38
kb (range 0.60-3: S.kb). 15/15 colonies contained inserts
by PCR. This library was enriched for full-length clones
and was constructed by Clontech Laboratories (Falo Alto,
CA). Note: this is a NIH_MGC Library."

Sequence 1, Application US/08814806
| Patent No. 598605
| GENERAL INFORMATION:
| APPLICANT: Mong, Hing C. |
| APPLICANT: Lawrence, Luepschen |
| TITLE OF INVENTION: ANTIBODIES FOR INHIBITING BLOOD |
| TITLE OF INVENTION: ANTIBODIES FOR INHIBITING BLOOD |
| TITLE OF INVENTION: COAGULATION AND METHODS OF USE THEREOF |
| NUMBER OF SEQUENCES: 26 |
| CORRESPONDENCE ADDRESS: |
| ADDRESSEE: Dike Bronstein, Roberts & Cushman, LLP |
| STREET: 130 Water Street |
| CITY: Boston |

Patent No. 6677436

GENERAL INFORMATION:
APPLICANT: SATO, KOH
APPLICANT: ADACH, HIDEKI
APPLICANT: YABUTA, MOGHIRO
TITLE OF INVENTION: HUMANIZED ANTHEODY AGAINST HUMAN TISSUE FACTOR (TF) A;
TITLE OF INVENTION: HUMANIZED OF PRODUCTION OF THE HUMANIZED ANTHEODY
TITLE OF INVENTION: HUMBER: US/09/647,468
FILE REFERENCE: 053466/0289
CURRENT FILING DATE: 1999-29
PRIOR FILING DATE: 1999-04-02
PRIOR PLING DATE: 1998-04-03
PRIOR FILING DATE: 1998-04-03
PRIOR FILING DATE: 1998-04-03
NUMBER OF SEQ ID NOS: 183
SOFTWARE: Patentin Ver. 2.1
SEQ ID NO 13
                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       OTHER INFORMATION: Description of Artificial Sequence: Nucleotide OTHER INFORMATION: sequence coding for L chain V region of anti-TF OTHER INFORMATION: mouse monoclonal antibody ATR-3

| Sequence 7, Application US/07789344A
| Patent No. 5318897
| GENERAL INRORMATION:
| APPLICANT: Sudhir: Paul
| TITLE OF INVENTION: WONOCLONAL ANTIBODY AND ANTIBODY
| TITLE OF INVENTION: COMPONENTS ELICITED TO A POLYPEPTIDE ANTIGEN
| TITLE OF INVENTION: GROUND STATE
| NUMBER OF SEQUENCES: 13
| CORRESPONDENCE ADDRESS:
| ADDRESSEE: Clutis, Morris & Safford
| CITY: New York

Sequence 22, Application US/09140084A
Patent No. 6300065
GENERAL INFORMATION:
APPLICANT: Kieke, et al.
TITLE OF INVENTION: Yeast Cell Surface Display of Proteins and Uses Thereof
FILE REFERENCE: D6661C1P2
CURRENT APPLICATION UNDBER: US/09/140,084A
CURRENT FILING DATE: 1998-08-26
NUMBER OF SEQ ID NOS: 26
SOFTWARE: PatentIN Ver. 2.0
SEQ ID NO 22
LENGTH: 366
                                                                                                                                                           GGGAAATCTCCTCAGCTCCTGATTTATGCTGCCACCAACTTGGCAGATGGGGTCCCATCA 180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              61 ATCACATGCCTGGCAAGTCAGACCATTGATACATGGTTAGCATGGTATCAGCAGAAACCA 120
